

ASP.NET Core in Action

Chapter 16: Publishing and deploying your application

19 February 2024

Q1. What is a reverse proxy?

- A. software that's stores cache version of HTML response generate against a particular request
- B. software that's responsible for receiving requests and forwarding them to the appropriate web server
- C. software that serves static resources of a web application
- D. software that's responsible for delivery of response to the client that made a request

Answer: B

[Page 505]

Q2. What does the publishing an application mean?

- A. compiling an application and running it
- B. building and packaging everything an application needs to run
- C. optimizing an application to improve performance
- D. building an application with release configuration

Answer: B

[Page 505]

Q3. To host and deploy your app on a server, you first need to ____it

- A. build
- B. build with release configuration
- C. publish
- D. configure

Answer: C

[Page 507]

Q4. Which command publishes an ASP.NET Core application with release configuration?

- A. dotnet publish --output publish
- B. dotnet build --output publish --configuration Release
- C. dotnet deploy --output publish --configuration Release
- D. dotnet run --output publish --configuration Release

Answer: C

[Page 508]

Q5. What is runtime-dependent deployment (RDD)?

- A. relies on the .NET 5.0 runtime being installed on the target machine that runs your published app
- B. the target machine doesn't need to have .NET 5.0 installed. Instead, publishing your app will package up the .NET 5.0 runtime with your app's code and libraries.
- C. the target machine doesn't need to have .NET 5.0 installed. Instead, the .NET 5.0 runtime and libraries are loaded from cloud
- D. the application relies on a container on the target machine

Answer: A

[Page 509]

Q6. What is self-contained deployment (SCD)?

- A. relies on the .NET 5.0 runtime being installed on the target machine that runs your published app
- B. the target machine doesn't need to have .NET 5.0 installed. Instead, publishing your app will package up the .NET 5.0 runtime with your app's code and libraries.
- C. the target machine doesn't need to have .NET 5.0 installed. Instead, the .NET 5.0 runtime and libraries are loaded from cloud

D. the application relies on a container on the target machine

Answer: B

Q7. What is required to install to host ASP.NET Core applications in IIS?

- A. Appropriate version of .NET SDK
- B. Appropriate version of .NET Core Runtime
- C. ASP.NET Core Windows Hosting Bundle
- D. IIS AspNetCore Module

Answer: C

[Page 512]

Q8. Which one provides the link between IIS and your app, so that IIS can act as a reverse proxy?

- A. The .NET Runtime
- B. The ASP.NET Core Runtime
- C. The IIS AspNetCore Module
- D. IIS Application Pool

Answer: C

[Page 512]

Q9. What is Bundling?

- A. concatenating multiple files into a single file, to reduce the number of requests.
- B. processing code to reduce its size without changing the behavior of the code
- C. compressing HTML response generated by the application
- D. loading CSS and JavaScript files from CDN

Answer: A

[Page 527]

Q10. What is Bundling?

- A. concatenating multiple files into a single file, to reduce the number of requests.
- B. processing code to reduce its size without changing the behavior of the code
- C. compressing HTML response generated by the application
- D. loading CSS and JavaScript files from CDN

Answer: B

[Page 527]

Q11. How can you conditionally include the original files when running in the development hosting environment, and to use the optimized files in other environments?

- A. Using the Bundler & Minifier Visual Studio extension
- B. Using the BuildBundlerMinifier NuGet package
- C. Environment Tag Helper
- D. Using @if statement

Answer: C
