

ASP.NET Core in Action

Chapter 17: Monitoring and troubleshooting errors with logging

19 February 2024

Q1. What is Logging?

- A. The process of decorating and instrumenting code to trace errors at various points during debugging
- B. The process of recording events or activities in an app, and it often involves writing a record to a console, a file, the Windows Event Log, or some other system.
- C. The process of monitoring health of an app using various performance counter
- D. The process of automating reproducible testing of an app

Answer: B

[Page 539]

Q2. What type of information can you record in a log message?

- A. Informational messages
- B. Warnings and errors
- C. Health of your app
- D. Performance of your app

Answer: A, B

[Page 539]

Q3. What is a logging provider?

- A. Logging providers control how each library and framework in your app format log message
- B. Logging providers control where your app writes your log messages
- C. Logging providers control sources of log message
- D. Logging providers control when to write log messages

Answer: B

[Page 540]

Q4. _____ involves attaching data to log messages as key-value pairs to make it easier to search and query logs.

- A. Logging
- B. Standard logging
- C. Structured logging
- D. Dictionary logging

Answer: C

[Page 540]

Q5. Which one is used to create implementations of ILogger?

- A. IHostBuilder
- B. ILoggerProvider
- C. ILoggerFactory
- D. IEventLogger

Answer: C

[Page 544]

Q6. What is the log level of a log?

- A. It indicates the source of the log
- B. It indicates where to write the log message
- C. It indicates how important the log is

D. It is a log event

Answer: B

[Page 546]

Q7. Which one is log level in the following log message?

info: RecipeApplication.Pages.IndexModel[0]

- A. info
- B. RecipeApplication.Pages.IndexModel
- C. [0]
- D. the log message has no log level

Answer: A

[Page 546]

Q8. Which one is the event category in the following log message?

info: RecipeApplication.Pages.IndexModel[0]

- A. info
- B. RecipeApplication.Pages.IndexModel
- C. [0]
- D. the log message has no event category

Answer: B

[Page 546]

Q9. Which one is the event id in the following log message?

info: RecipeApplication.Pages.IndexModel[0]

- A. info
- B. RecipeApplication.Pages.IndexModel
- C. [0]
- D. the log message has no event category

Answer: C

[Page 546]

Q10. How many elements can a log record have?

- A. 3
- B. 4
- C. 5
- D. 6

Answer: D

[Page 548]

Q11. Which one of the following log levels is most important?

- A. LogLevel.Critical
- B. LogLevel.Error
- C. LogLevel.Warning
- D. LogLevel.Debug

Answer: A

[Page 548]

Q12. Which one of the following log levels is least important?

- A. LogLevel.Critical
- B. LogLevel.Error
- C. LogLevel.Warning
- D. LogLevel.Debug

Answer: D

[Page 548]

Q13. Every log message has an associated category. The category is typically set to

-
- A. the content of the log message
 - B. the name of the class creating the log message
 - C. an integer identifier for the error
 - D. the provided parameters.
-

Answer: B

[Page 549]

Q14. Which one is not a log provider for ASP.NET Core?

- A. Console provider
- B. Text provider
- C. Debug provider
- D. EventLog provider

Answer: B

[Page 550]

Console provider

Debug provider

EventLog provider

EventSource provider]

Q15. Which log provider writes messages to the Windows Event Log. Only outputs log messages when running on Windows?

- A. Console provider
- B. Debug provider
- C. EventLog provider
- D. EventSource provider

Answer: C

[Page 550]

Q15. Which log provider writes messages using Event Tracing for Windows (ETW) or LTTng tracing on Linux?

- A. Console provider
- B. Debug provider
- C. EventLog provider
- D. EventSource provider

Answer: D
